DUAL PREAMPLIFIER FOR TAPE RECORDER

The TA7658P is a dual preamplifier with ALC (Automatic Level Control) designed for use in a record/playback amplifier of tape recorder. It is suitable for a stereo set and a radio-cassette recorder.

- DIP 14 PIN (Dual In-Line Package)
- Built-in Buffer Amplifier (It permits meter drive and ALC to be easily performed)
- No Input Coupling Capacitor
- Quick Stabilization at Power ON.
- Wide Supply Voltage Range: $V_{CC}=3 \sim 16V$

TA7658P**EQUIVALENT CIRCUIT**

TA7658P**DESCRIPTION OF EQUIVALENT CIRCUIT****1) BIAS CIRCUIT**

The constant current circuit formed by Q₁ and Q₂ is connected to the constant current bias source composed of being free from power supply variation for the purpose of obtaining a bias source of higher power supply ripple suppression ratio. Therefore, the operating current of the first stage transistor Q₆ is not affected by the power supply variation, and the ripple suppression ratio shows a good characteristic since the operating electric potential of the first stage (Q₇ collector) is stabilized, thus requiring no decoupling at the first stage.

2) AMPLIFIER

The first stage is a complimentary differential stage of Q₆ and Q₇, the input terminal voltage (Q₆ base) is about "0"V, and the playback head can be directly coupled without a chemical capacitor.

Q₁ not only sets the first stage current, but also functions as an active load. The medium stage Q₉ is approximately a phase inverter and level shift stage for the gain 1. The output stage Q₁₀ is the emitter ground stage changing Q₁₂ to an active load. The current is defined by Q₁₁ and Q₁₂ as $I(Q_{10}) \approx 1.6\text{mA}$.

At the back of the output stage, the emitter follower Q₁₃ is directly coupled in IC for buffering. Q₁₃ is an open emitter, and the operating current can be arbitrarily selected by an external resistor.

3) ALC CIRCUIT

The transistor Q₅ for ALC (Automatic Level Control) is DC-coupled to the input terminal. Therefore, Q₆ bias resistor is connected in parallel between the collector and emitter of Q₅. ALC control terminal ⑦ (Q₄ base) is DC-biased in about 0.55V by Q₃. Consequently, attack time can be shortened since the smoothing capacitor for ALC has been biased in 0.05V from the beginning.

4) VOLTAGE GAINo Open Loop Voltage Gain G_{V0} (1kHz) in Amplifier

$$G_{V0}(1\text{kHz}) = \frac{1}{2r_e(Q_6) \cdot R_{10}} \times h_{FE}(Q_{10}) \times R_L \text{ is obtained.}$$

AUDIO LINEAR IC

9097247 TOSHIBA, ELECTRONIC

02E 17485

D T-77-21

TA7658P

IF $\frac{1}{h_{oe}(Q_1)} = 50k\Omega$
 $h_{FE}(Q_{10}) = 20$
 $R_L = 10k\Omega$
 $2r_e(Q_6) = 1k\Omega$
 $R_{10} = 1.8k\Omega$

} is given, $G_{V0} \approx 5.5 \times 10^3 \approx 74.9 \text{dB}$
is realized.

$\left(\begin{array}{l} \frac{1}{h_{oe}(Q_1)} \dots \dots Q_1 \text{ output impedance} \\ 2r_e(Q_6) \dots \dots Q_6 \text{ emitter junction resistance} \end{array} \right)$

o Close Loop Voltage Gain $G_V(1\text{kHz})$

$$G_V(1\text{kHz}) = \frac{G_{V0}}{1 + \beta \cdot G_{V0}} \dots \dots \quad (1) \quad (\beta = \text{Feedback ratio})$$

$$\beta = \frac{Z_1}{Z_1 + Z_2} \dots \dots \quad (2) \quad \text{is made.}$$

If $G_{V0}=75\text{dB}$
 $Z_1=100\Omega$
 $Z_2=13.3k\Omega$

} are given, put the equation (1) into
the equation (2),

$$G_V(1\text{kHz}) = 1.32 \times 10^2 = 42.4\text{dB} \text{ is obtained.}$$

o Selection of External Resistors R_1 and R_2

R_1 and R_2 in the internal equivalent circuit should be appropriately selected to obtain output as much as possible. Output terminals (L) = pin 3 and (R) = pin 12 can obtain the maximum output at the time of $1/2 V_{CC}$. Therefore, the values of R_1 and R_2 may be selected according to the following equations.

$$V_{12}(V_3) = \frac{V_{CC}}{2} = \frac{R_1+R_2}{R_2} \times V_{10}(V_5) \quad V_{10}(V_5) = 1.1 \sim 1.2V$$

L channel is shown in (V3).

Graph "V_{OM}, R₂-V_{CC}" shows the relation between V_{CC} and the maximum output at the time when $R_1=150k\Omega$ as parameter R_2 . The value of R_2 should be selected by taking the characteristics at decreasing voltage into due consideration.

T-77-21

TA7658P

5) ALC ATTACK TIME AND RECOVERY TIME SETTING

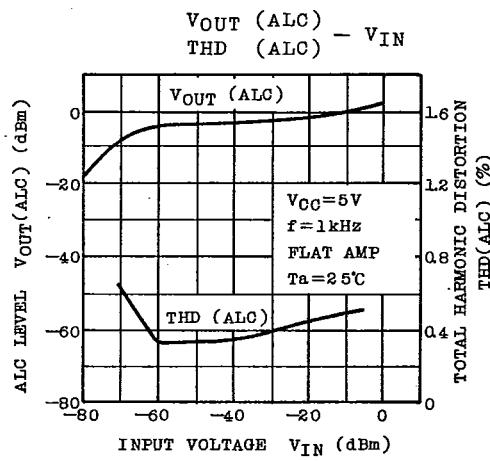

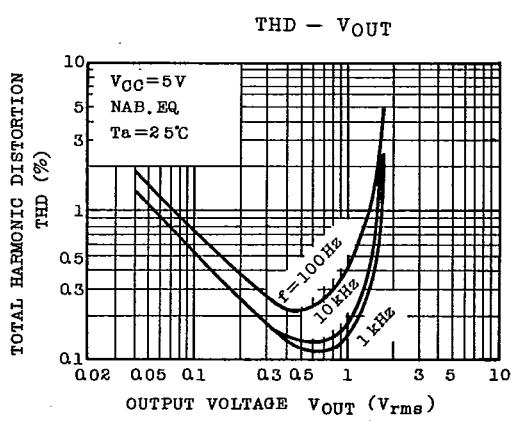

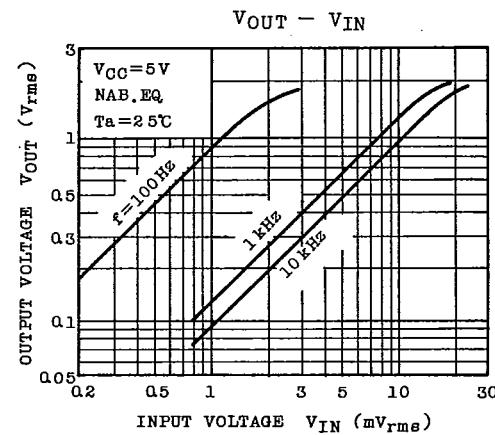

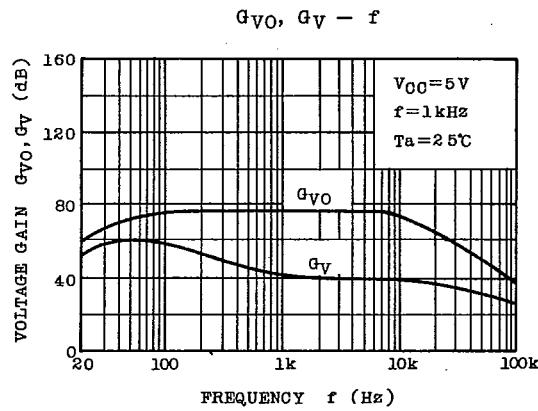

The attack time from the application of the input signal to the starting of ALC can be adjusted by the time constants of R₃ and C₂, while the recovery time from no application of the input signal to the restoration of amplifier gain can be adjusted by the time constants of R₄ and C₂. In addition, silicon diode should be used for D₁ and D₂, while germanium diode for D₃ and D₄. A capacitor of 47μF or more should be used for C₂.
