PRESETTABLE DIVIDE-BY-N COUNTER

The HEF4018B is a 5-stage Johnson counter with a clock input (CP), a data input (D), an asynchronous parallel load input (PL), five parallel inputs (P₀ to P₄), five active LOW buffered outputs (\bar{O}_0 to \bar{O}_4), and an overriding asynchronous master reset input (MR). Information on P₀ to P₄ is asynchronously loaded into the counter while PL is HIGH, independent of CP and D inputs. When P_L is LOW, the counter advances on the LOW to HIGH transition of CP. By connecting \bar{O}_0 to \bar{O}_4 to D, the counter operates as a divide-by-n counter (n = 2 to 10; see also function selection below). Each register stage is a D-type master-slave flip-flop with a set-direct/clear-direct input. An internal code correction circuit provides automatic code correction of the counter. From any illegal code the counter is in a proper counting mode within 11 clock pulses. A HIGH on MR resets the counter (\bar{O}_0 to \bar{O}_4 = HIGH) independent of all other inputs.

Fig. 1 Functional diagram.

FUNCTION SELECTION

counter mode; divide by	connect D input to	remarks
10 8 6 4 2	\bar{O}_4 \bar{O}_3 \bar{O}_2 \bar{O}_1 \bar{O}_0	no external components needed
9 7 5 3	$\bar{O}_3 \cdot \bar{O}_4$ $\bar{O}_2 \cdot \bar{O}_3$ $\bar{O}_1 \cdot \bar{O}_2$ $\bar{O}_0 \cdot \bar{O}_1$	AND gate needed; counter skips all HIGH states

PINNING

- PL parallel load input
- P₀ to P₄ parallel inputs
- D data input
- CP clock input (LOW to HIGH edge triggered)
- MR master reset input
- \bar{O}_0 to \bar{O}_4 buffered output (active LOW)

APPLICATION INFORMATION

Some examples of applications for the HEF4018B are:

- Programmable divide-by-n counter
- Programmable frequency division
- Timers
